

## Adding Structure to Experimentation: FORCEnet Innovation & Research Enterprise F.I.R.E.

**Experimentation Management System** 

Design, Analysis, Assessment and Reporting

Dr. Shelley P. Gallup, Dr. Randy Maule, Dr. Gordon Schacher Naval Postgraduate School

#### What's the problem?

- Perceived lack of rigor in experimentation.
- Complex assortment of stakeholders.
- Dynamic nature of programs, initiatives and objectives.
- Planning is not linear.
- Organizational boundaries.
- E-mail is not collaboration, and no way to keep up.
- Project management and status reporting.
- Many inputs to the experiment definition, planning, analysis and reporting process.
- Many expected outputs for the results of experimentation.

#### What's the solution?

- Enterprise system approach to database design that is integrated with the <u>tasks</u> of experiment planning, management, design, execution, analysis and reporting.
- Adopt a <u>systems-design methodology</u>, enabled by the enterprise.
- Structured approach <u>introduces rigor</u> to the process, and to results.
- Provide a collaborative environment for planning, execution, analysis and reporting.
- Database structure is open via ontology and .xml to import data from other databases, or as input to other databases.
- Supports incremental design improvements to programs of record.

#### Impact....

- Increase understanding and participation among all planners, summarize info for management, construct threads between objectives, events, data, and results.
- Create a Federated data structure for use throughout the FORCEnet Enterprise.
- Approximately 500 <u>active</u> users.

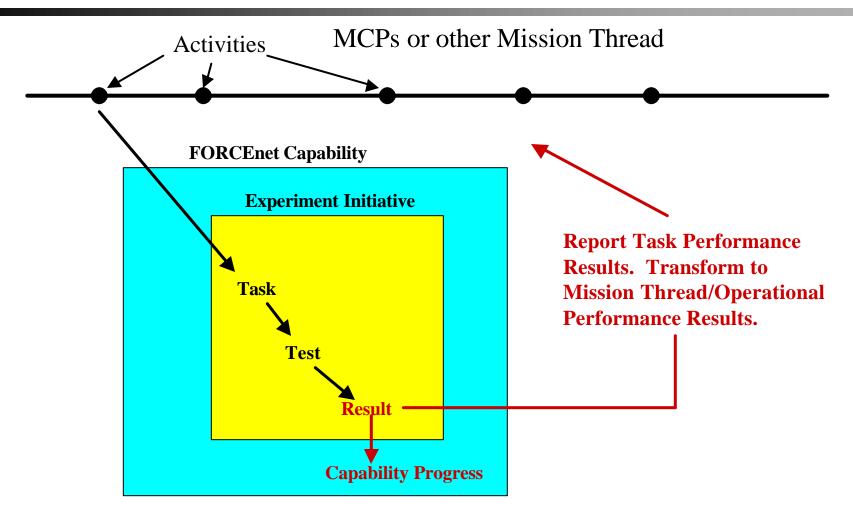

Past experiment design efforts felt like....

#### FIRE is an INPUT and RESOURCE

- To Navy Capabilities Development Process (NCDP)
  - FORCEnet Capabilities to attributes to measures mapping
  - Experimentation Results
  - Experimentation Recommendations to Military Utility
     Assessments
- FORCEnet Integrated Baseline (FIBL)
  - Connection to EDISON for industry input
  - Shared data to FORCEnet Consolidated Compliance Checklist
    - TXC (Technology Exchange Clearinghouse)
    - VKR (Virtual Knowledge Repository)

Relationships between Tasks, their experiment results, and means to roll up to higher levels of interest will all be contained in FIRE.

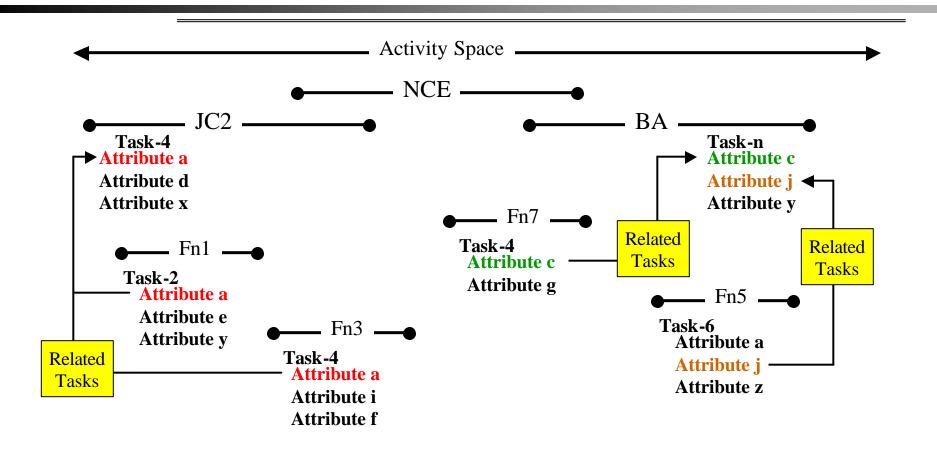

### Providing Results to Other Users TW to Joint Functional Areas Example

- Step1. Produce experiment Objective results.
- Step 2. Map results to FORCEnet Capabilities (TW requirement).
  - •Objectives/results address FORCEnet functional tasks.
  - •Results produce Measures for specific Attributes.
- Step 3. Match FORCEnet Tasks and Attributes to Joint Tasks and Attributes.
- Step 4. Apply Measures scaling, as necessary, to address directly Joint Tasks.

Mapping is provided automatically in F.I.R.E.

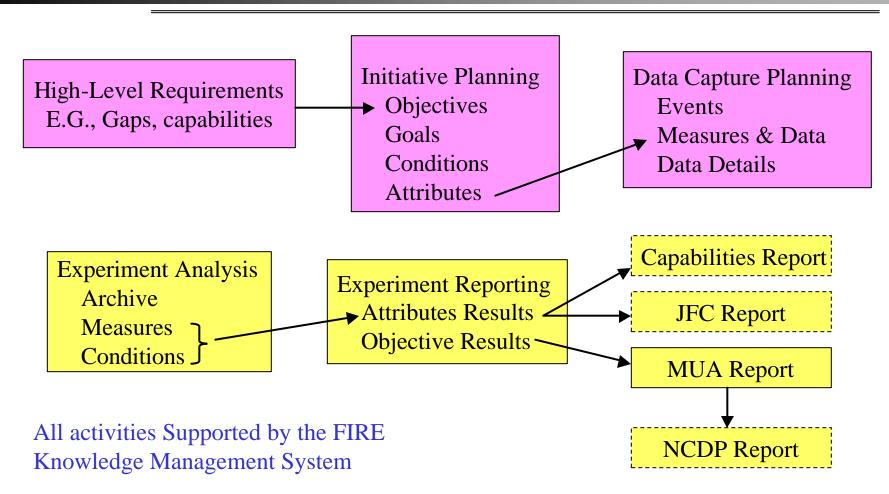

#### **Capabilities to Functional Areas**

Tasks and Attributes are related but not necessarily exactly the same, interpretation or scaling to the new task may be necessary.

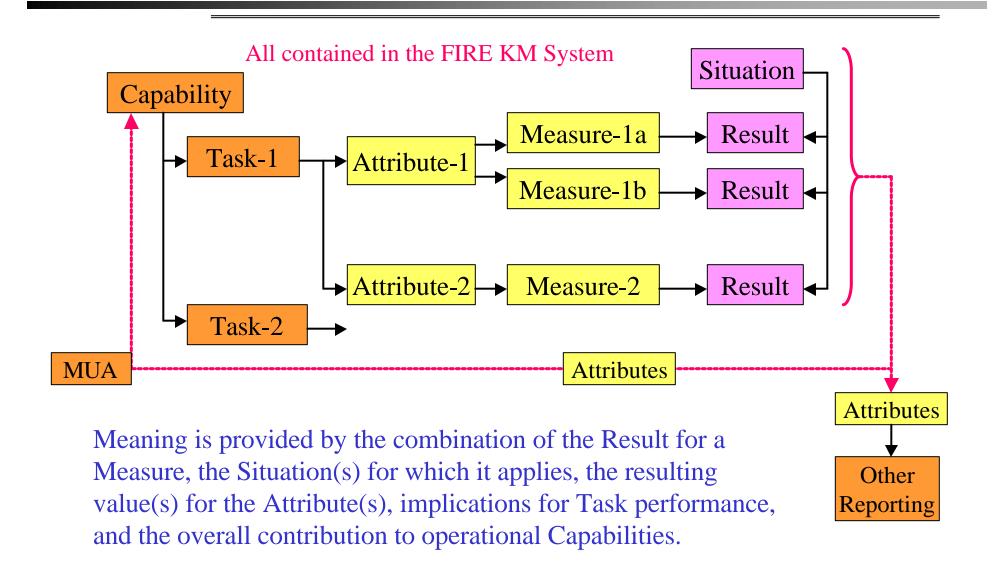

#### **NPS/FORCEnet Experimentation Process**

Capabilities and Attribute mapping are keys to tailored reporting for specific interest areas.

#### **Attribute > Result Mapping > Roll-Ups**

#### FIRE as Enabler

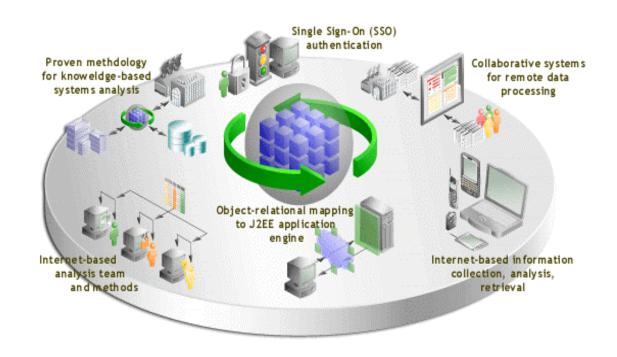

- Experimentation is a set of closely coordinated and collaborative tasks.
- •Each user has a profile that specifies areas of access as a User of FIRE edit functions, or as a viewer of information.
- •Oracle Collaborative Tools provide means for desktop sharing, VOIP, instant messaging (not over NMCI) as an alternative to VTCs.
- •Al's provide search capabilities within indexed data repository, and data pulled from authorized databases.

#### **Experimentation Innovation**

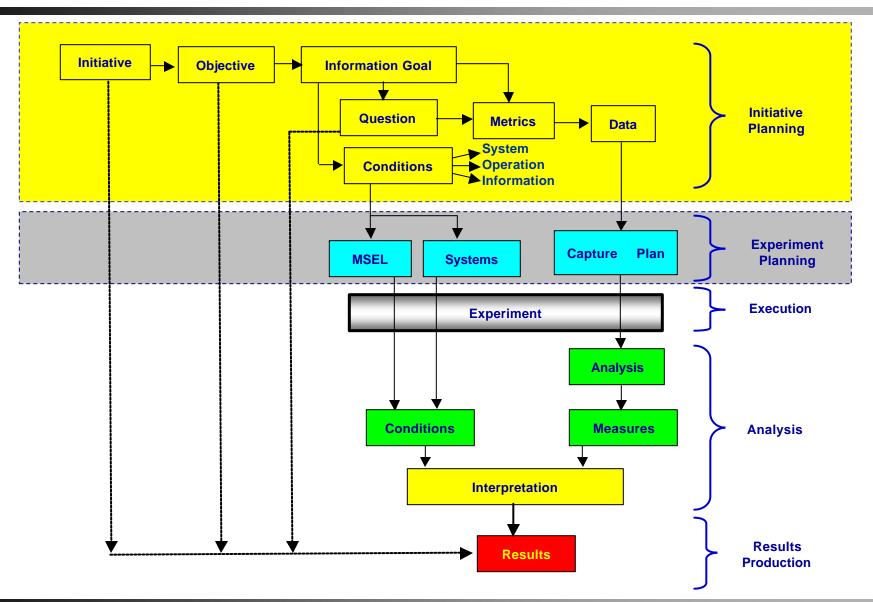

#### Oracle 10g based

- First enterprise application to work both NMCI and non-NMCI
- J2EE 1.4 standard industry architecture for portal, web services, SOA, single sign-on, browser-based
- Roll-up summaries from initiatives, data, programs
- Connection between objectives and results is preserved

#### High Level Task-Flow

#### **Trident Warrior**

13 Step Process

#### Based on Code of Best Practices for Experimentation (COBPE)

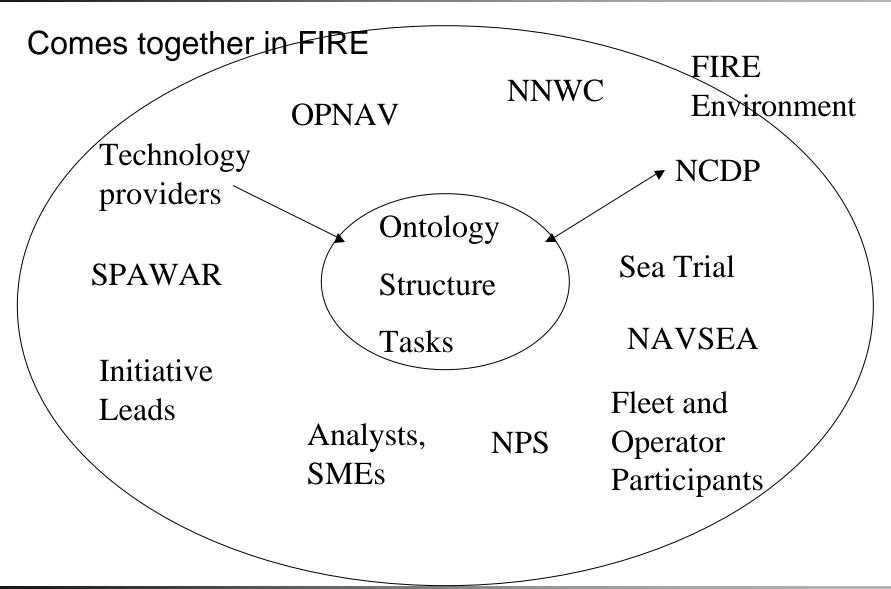

#### **Trident Warrior 13-Step Process**

#### **Summaries of Results**

- First level summary derived from data, answers questions posed at the objective level.
- Second level summary combines objective summaries within an initiative area to construct a single high level summary of the initiative
- Summary results used in higher level reporting (OAA and MUA).

F.I.R.	E. Overview										

#### FIRE—Future.....NTIRA

Federate the family of authoritative databases to perform multiple tasks

Examples:

Objectives....defined in FIRE.....run in NTIRA for validation and pre-experiment analysis

Post experiment analysis.....produces improved metrics.....provided back to NTIRA for improved model parameters

#### FIRE—Future.....DARS

Architectures in the DoD Architecture Repository System (DARS)

Imported into FIRE as notional model of objectives (IDEF and OSDs translate to OVs, TVs used for technical objectives).

Experimentation adjusts notional models to produce "experimentation architectures" and added back to DARS

#### FIRE—Future.....FIBL & FCCC

Fn Capabilities

tasks

attributes

measures

Vetted in experimentation

Become part of the FCCC and FIBL process

#### FIRE—Future.....EDISON

Shared databases between Virtual Knowledge Repository, Technology Exchange Clearinghouse and FIRE

 Make the technologies solutions available in industry part of experimentation

#### Conclusion

#### **FIRE provides:**

- A FORCEnet I&E environment for experimentation
- Connections between High level concepts, Joint Functional Concepts, FORCEnet Functional Concepts, NCDP to experiment objectives, data (attributes associated to Fn Capabilities), results and recommendations.
- A collaborative environment in which experiment planning tasks are conducted by all participants
- An additional database that connects experimentation with other authoritative databases for acquisition (NTIRA) and regulation (FIBL).
